(a) 3-ball of u, onion layers; size $= p^3_{uj}$
u
$d = 1$
$d = 2$
$d = 3$
(b) how concentrated
values $p^w_{uj'}$ wherever they are $\to$ ϕ^w_u
$w = 1$
$w = 2$
$w = 3$
Re $\phi^w_u(\theta)$
Im $\phi^w_u(\theta)$
(c) how far
law of $d(u, X_w)$ $\to$ layer masses
$s^w_u(k)$, $k = 0..w$
$\|\Theta\|\, s^w_u$
θ log-spaced in $[1, 100]$; shade = magnitude. Per step: $20 + (w+1)$ coordinates; over $w = 1, 2, 3$: $60 + 9 = 69$
